	Table 1: Payback time and CO ₂ emissions	1
	Table 2: Inputs into the Scottish Government Carbon Calculator	3

1 Introduction

This Appendix presents the findings of the Carbon Calculations prepared for the Proposed Development and should be read in conjunction with Chapter 13 Climate Change and Carbon Balance.

Therefore, the Scottish Government's Online Carbon Calculator v1.8.1 (updated in December 2023) was used to calculate the carbon cost and payback period of the Proposed Development.

The online Reference for the Carbon Calculator is CZS7-1TLY-VOE0 v3.

Table 1 and Table 2, presented below to summarise out the outputs and inputs respectively. These are presented with 'Expected' values – the best estimate of the anticipated value, based on the current understanding of the Proposed Development – along with 'minimum' and 'maximum' values to give a range of possible outputs, dependent on the variables within the model.

Table 1: Payback time and CO₂ emissions

	Expected	Minimum	Maximum				
1: Wind farm CO2 Emission Saving over (tonnes CO ₂ eq.):							
Coal Fired electricity Generation	86,921	78,229	95,613				
Grid mix of electricity generation	19,040	17,136	20,944				
Fossil fuel mix of electricity generation	39,000	35,100	42,899				
Energy output from windfarm over lifetime (40 years) (MWh)	3,679,200	3,311,280	4,047,120				
Total CO2 emissions due to wind farm (tCO2 ed	ą.)						
2. emissions due to turbine life (e.g. manufacture, construction, decommissioning)	27,161	27,161	27,161				
3. emissions due to backup	22,285	22,285	22,285				
4. emissions due to reduced carbon fixing potential	1,111	289	6,251				
5. emissions from soil organic matter	13,131	998	99,499				
6. emissions due to DOC & POC leaching	3	0	63				
7. emissions due to felling forestry	0	0	0				
Total emissions of Carbon dioxide	63,693	50,734	155,261				
Total CO ₂ gain due to improvement of site (tCC	D2 eq.)						
8a. gains due to improvement of degraded bogs	-71	0	-212				
8b. gains due to improvement of felled forestry	0	0	0				
8c. gains due to restoration of peat form borrow pits	0	0	0				
8 d. gains due to removal of drainage from foundations and hardstandings	-333	0	-4571				
Total gains	-404	0	-4783				
Results: Carbon Payback Time							
Net emissions of carbon dioxide († CO2 eq.)	63,288	45,951	155,261				

	Expected	Minimum	Maximum
Coal Fired electricity Generation (years)	0.7	0.5	2
Grid mix of electricity generation (years)	3.3	2.2	9.1
Fossil fuel mix of electricity generation (years)	1.6	1.1	4.4
Carbon Intensity (gCO2e/kWh)	17.20	11.35	46.89

Improvement of C sec	uestration o	at site by bloc	cking drains, r	estoration of habitat, etc
Area of degraded bog to be improved (ha)	0.6	0.6	0.6	Technical Appendix 6-5 Habitat Management Plan
Water table depth in degraded bog before improvement (m)	0.3	0.1	0.5	The Carbon Calculator notes that water table depth should be measured on site. However, where site-specific values are not available, for degraded peat, reasonable estimated minimum, expected and maximum values are: 0.1 m, 0.3 m and 0.5 m, respectively.
Water table depth in degraded bog after improvement (m)	0.1	0.05	0.3	The Carbon Calculator notes that water table depth should be measured on site. However, where site-specific values are not available, for intact peat, reasonable estimated minimum, expected and maximum values are: 0.05m, 0.1m, 0.3m respectively.
Time required for hydrology and habitat of bog to return to its previous state on improvement (years)	15	5	30	Carbon Calculator requires that a value between 2 and 30 is input. Values of 5, 15 and 30 used for min, max and expected to show worst case scenario.
Period of time when effectiveness of the improvement in degraded bog can be guaranteed (years)	30	30	30	Due to uncertainty this value has been set the maximum that the carbon calculator requires a value between 2 and 30 years. 30 years chosen for worst case
Area of felled plantation to be improved (ha)	0	0	0	n/a no felling will take place
Water table depth in felled area before improvement (m)	0.3	0.1	0.5	The Carbon Calculator requires a value and notes that water table depth should be measured on site. However, where site-specific values are not available, for degraded peat, reasonable estimated minimum, expected and maximum values are: 0.1 m, 0.3 m and 0.5 m, respectively.

	Expecte	Minimum	Maximum	
Input date	d value	value	value	Source of Data
Water table depth in felled area after improvement (m)	0.1	0.05	0.3	The Carbon Calculator requires a value and notes that water table depth should be measured on site. However, where site-specific values are not available, for intact peat, reasonable estimated minimum, expected and maximum values are: 0.05m, 0.1m, 0.3m respectively.
Time required for hydrology and habitat of felled plantation to return to its previous state on improvement (years)	30	30	30	Carbon calculator requires a value between 2 and 30 years. 30 years chosen for min, expected and max, to illustrate worst case scenario.
Period of time when effectiveness of the improvement in felled plantation can be guaranteed (years)	30	30	30	Carbon calculator requires a value between 2 and 30 years. 30 years chosen for min, expected and max, to illustrate worst case scenario.
Area of borrow pits to be restored (ha)	3.27	3.27	3.27	Chapter 3 Description of Development
Depth of water table in borrow pit before restoration with respect to the restored surface (m)	0	0	0	This will be dependent upon water table levels and borrow pit design. Due to this, it is assumed on a highly conservative basis for the purpose of the carbon calculator that there will be no change in the water table depth and therefore no "gain". This value is therefore presented as "0".
Depth of water table in borrow pit after restoration with respect to the restored surface (m)	0	0	0	This will be dependent upon water table levels and borrow pit design. Due to this, it is assumed on a highly conservative basis for the purpose of the carbon calculator that there will be no change in the water table depth and therefore no "gain". This value is therefore presented as "0".
Time required for hydrology and habitat of borrow pit to return to its previous state on restoration (years)	30	30	30	Carbon calculator requires a value between 1 and 30 years. 30 years chosen for worst case scenario.
Period of time when effectiveness of the restoration of peat removed from borrow pits can be guaranteed (years)	30	30	30	Carbon calculator requires a value between 1 and 30 years. 30 years chosen for worst case scenario.
Water table depth around foundations and	0.3	0.1	0.5	The Carbon Calculator notes that water table depth should be measured on site. However, where site-specific values are

Input date	Expecte d value	Minimum value	Maximum value	Source of Data
hardstanding before restoration (m)				not available, for degraded peat, reasonable estimated minimum, expected and maximum values are: 0.1 m, 0.3 m and 0.5 m, respectively.
Water table depth around foundations and hardstanding after restoration (m)	0.1	0.05	0.3	The Carbon Calculator notes that water table depth should be measured on site. However, where site-specific values are not available, for intact peat, reasonable estimated minimum, expected and maximum values are: 0.05 m, 0.1 m and 0.3 m, respectively.
Time to completion of backfilling, removal of any surface drains, and full restoration of the hydrology (years)	5	5	5	Carbon calculator requires a value between 0.1 and 5 years. 5 years chosen for worst case.
